Idaho Athletic Club's 5th state of the art fitness facility is a 11,056 square foot single story building located in Eagle River development. Primary building materials include stucco, hardiboard siding, stone veneers, aluminum storefront framing system and concrete roof tiles.

Glass curtain walls allow foothills views from the exercise equipment. Stained concrete floors and translucent panel walls give the interior a contemporary urban energy. The building façade is broken up by vertical and horizontal fenestration as well as pitched roof elements. Building parapets screen the rooftop mechanical units.

Inside, the facility includes a day care, general exercise equipment area, nautilus shaped stretching room, fitness class space, office area and large locker rooms.

Additionally, an energy model was developed during design. This indicated that an upgrade to the glazing system would yield enough energy savings to eliminate three of the rooftop mechanical units, providing both immediate and long term savings.
